NAVA AI

PRIVACY / 02

Privacy Policy

A plain-language explanation of local speech, screen context, files, and third-party apps.

Local by design

The bundled speech and punctuation models run on your Windows computer. NAVA AI is not a hosted chatbot and does not send ordinary microphone audio to a NAVA server.

1. Microphone and screen access

When enabled, NAVA AI reads microphone input to recognize wake phrases, commands, and dictation. Some controls use screenshots, Windows accessibility metadata, OCR, or browser accessibility information to locate visible targets. These inputs are used to perform the requested local action.

2. Local files and logs

The app may create local settings, app catalogs, diagnostic logs, cached browser data, and user-selected recordings or downloads. These remain on the computer unless you choose to copy or share them. Remove sensitive data before sharing diagnostics.

3. Websites and third-party apps

When you ask NAVA AI to open a website or use an application, that application’s own privacy policy applies. NAVA AI does not control how a third-party service processes information you enter there.

4. Installer and updates

The installer downloads the release files you select from the published release. Windows, GitHub, browsers, Office, and other services may collect their own technical data under their policies.

5. Your choices

- Turn NAVA AI off or disable its microphone from the app controls.
- Remove sign-in startup from Windows settings or the installer shortcut.
- Delete local logs and cached data using normal Windows file management.

6. Contact

Questions and privacy concerns can be raised through github.com/ZahraRehmat/NavaAI. This preview policy may be revised as the project develops.
